PRESS RELEASE

[For immediate release](#)

Talkgroup Affiliation and Silent Listeners

Genesis EMEA Operations (UK) announced today that updates to the Talkgroup Affiliation report are now able to identify radios that are affiliated to a Talkgroup, even when the radio does not transmit or provide a mobility update by moving and affiliating to a site.

This means that a radio could be affiliated to a particular Talkgroup, but without this new report from Genesis, it would remain unidentified even though it could be listening to all the communications on that Talkgroup.

Call data is stored in the GenSZAI Database and is available as and when the end-user requires, from an immediate report or from a longer-term archive. The long-term archive stores all the acquired data in its original form, so detailed reports can be run or re-run at any time in the future with the same degree of integrity.

The Genesis performance management tool acquires Motorola ATIA data in real time and, after processing, stores this data in a SQL database. The tool uses Excel as templates for querying the data and presenting the results, which enables data to be extracted quickly and easily with a minimum amount of training. Full call information including group, private and interconnect calls, site and Talkgroup affiliations, mobility updates and status messaging are all recorded.
